### **Abstract**

Changes in the synthesis of extracellular metabolic products generated by sulfate-reducing bacteria *Desulfovibrio desulfuricans* grown on a lactate-containing mineral medium in the presence of H<sub>2</sub> and CO<sub>2</sub> at various volume ratios in the gaseous phase were studied. An increase in the amount of extracellular products synthesized by the bacteria was observed at an H<sub>2</sub>/CO<sub>2</sub> ratio of 3:1. High concentrations of molecular hydrogen (80-95%) in the presence of 5-20% CO<sub>2</sub> facilitated the synthesis of hydrocarbons (alkanes) whose highest concentrations were produced at an H<sub>2</sub>/CO<sub>2</sub> ratio of 9:1. An increase in the initial CO<sub>2</sub> concentration in the gaseous phase above 20% increased the amount of oxygenated compounds in the culture.
